**Title: 'Oxygen supports burning'**

**Submitted by: Mihika Gorey [Magill School]**

**Keycode: D5K23WPT**

**REPORT:**

**Aim:** To study the concept that oxygen from the air is required for burning.

**Materials:** All household materials were used. 3 glass containers, 3 tealights, mobile phone timer and a match box.

**Multimedia support:** I recorded steps in the experiment on my iPad and then used iMovie app to make it into a presentation.

**Challenges:** Burning times made the video recording long. To address this, the recording speed was altered (to fast) during some parts of the experiment.

**Acknowledgements:**

I brainstormed the topic for this entry with my mum and dad.

My family helped me set up the experiment, provided me with a timer and lit tea lights. They also supported me with the written report, editing of my presentation and submitting my entry.
